

Machine Maintenance Inspection

Inspection Date: 13 September 2026
Facility: Production Facility D
Inspection Type: Routine Machinery Inspection

1. Executive Summary

A routine machinery inspection was performed to assess operating condition, guarding, vibration, lubrication, emergency controls, and maintenance records. The machine was operational, but maintenance-related observations require follow-up.

2. Equipment Condition

The primary production machine was operational. Moderate vibration was observed near the drive assembly. A protective guard requires tightening before extended heavy operation.

3. Safety Violations

The machine guard was not fully secured. The operator area was otherwise maintained in acceptable condition during the inspection.

4. Mechanical Observations

The drive assembly should be investigated for the source of vibration. Lubrication points were accessible, but the previous preventive-maintenance entry was incomplete.

5. Corrective Actions

Secure the protective guard, investigate vibration, complete the preventive-maintenance record, and verify the machine during a controlled test run.

6. Inspector Recommendation

Complete corrective maintenance before prolonged heavy operation and perform a follow-up inspection after servicing.

Inspection Findings Summary

Finding	Priority	Recommended Action
Loose machine guard	High	Secure and inspect
Excessive vibration	Medium	Investigate and service
Incomplete maintenance record	Low	Update records
